

**Mr.
Open
Banking**

Building the Optimal Architecture for Open Banking

Presented @ Open Banking Townhall 2024
Mexico City, Mexico – 05/16/24

**Mr.
Open
Banking**

Open banking is about APIs.

What is an API?

1960–1980

1980–1990

1990–2000

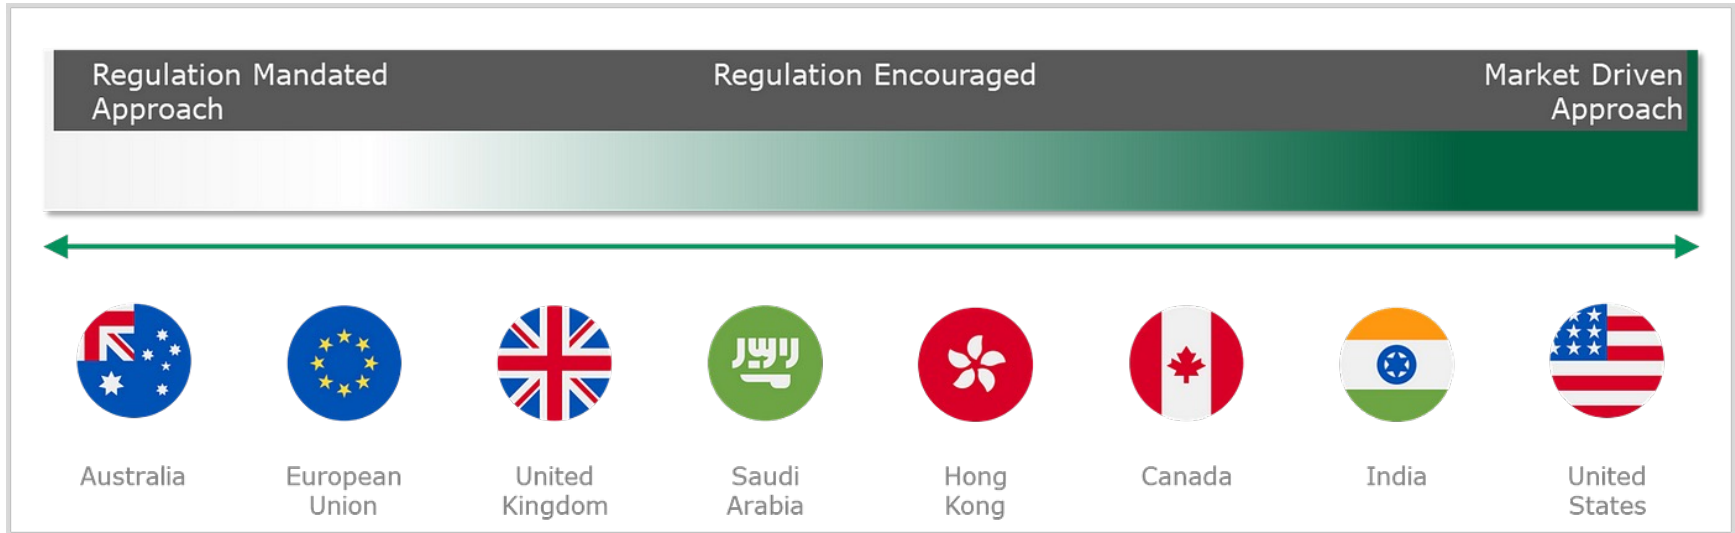

2000–today

What is open banking?

Regulation vs. Market | Some regions regulate while some are market-driven

These two approaches end up greatly affecting the solution architecture.

Architecture Focus | Regulations drive APIs, but markets drive ongoing innovation

**Standardized
Interoperable APIs**
(API Management)

Regulation-Driven

Architectural Concerns

(Full Stack)

- Open APIs & Open Data
- Developer Experience
- Common Standards

**Continuous Innovation
& Continuous Delivery**
(Digital Transformation)

Market-Driven

- Agile Requirements Definition
- Consumer-Driven Contracts
- Precise scaling and enhancement
- Distributed Data using Events
- Unstructured “Big” Data Lakes
- Automated DevOps deployment
- Public cloud native (containers)
- Continuous Improvement (CI/CD)

To succeed at open banking, banks must deliver *both* APIs & innovation.

Banking Platforms | Banks are becoming platforms in order to extend their reach

The Banking Platform Strategy

(An extension of the Digital Transformation Strategy)

open banking → open finance → bank-as-a-platform → bank-as-a-service → embedded finance

**Publish Open
Banking APIs**

**Grow a Strong
Developer Ecosystem**

**Embed Capabilities
into Digital
Contexts**

For embedded finance, API portals are the channel and APIs are the products

What is the real challenge?

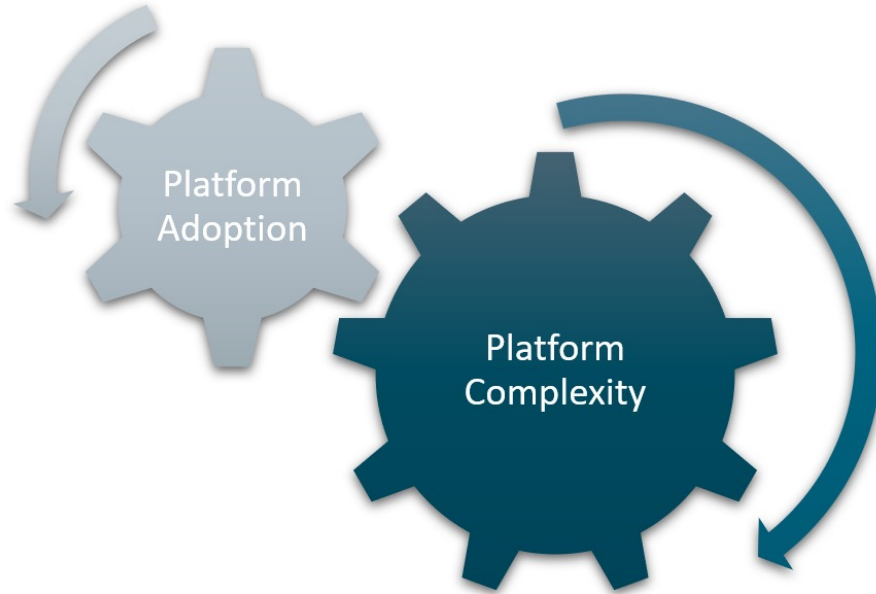

What is the single most important **customer segment** for a twenty-first century platform-driven bank?

Developers

Platform Adoption | Driving developer adoption demands continuous innovation

The more a platform is adopted by **developers**...

...the faster it will need to innovate, leading to increased **complexity**.

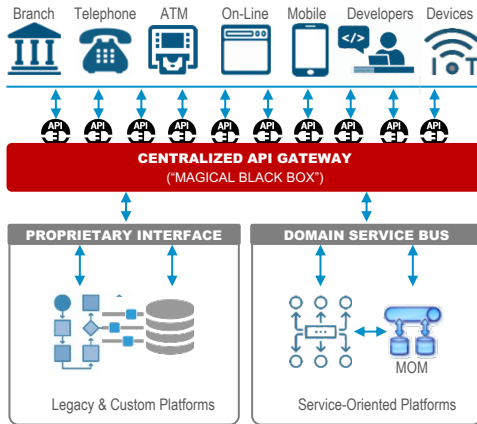

Developer demands will drive faster release cycles and more complex

Do my APIs support innovation?

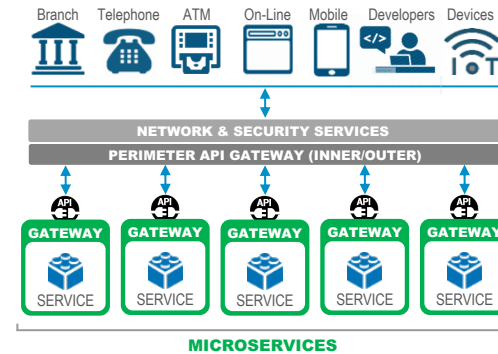

The Role of API Gateways | Beware the “Magical Black Box” approach

Centralized Gateway

Distributed Gateway

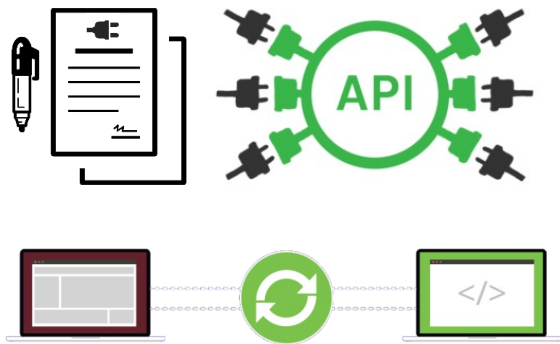

A distributed approach pushes gateway functions to individual

Microservices Explained | APIs and microservices are *not* the same thing

APIs are the contract

APIs only define what data you send in and what data will be sent back.

Microservices are the implementation

Microservices allow each piece to be independently upgraded, managed & scaled.

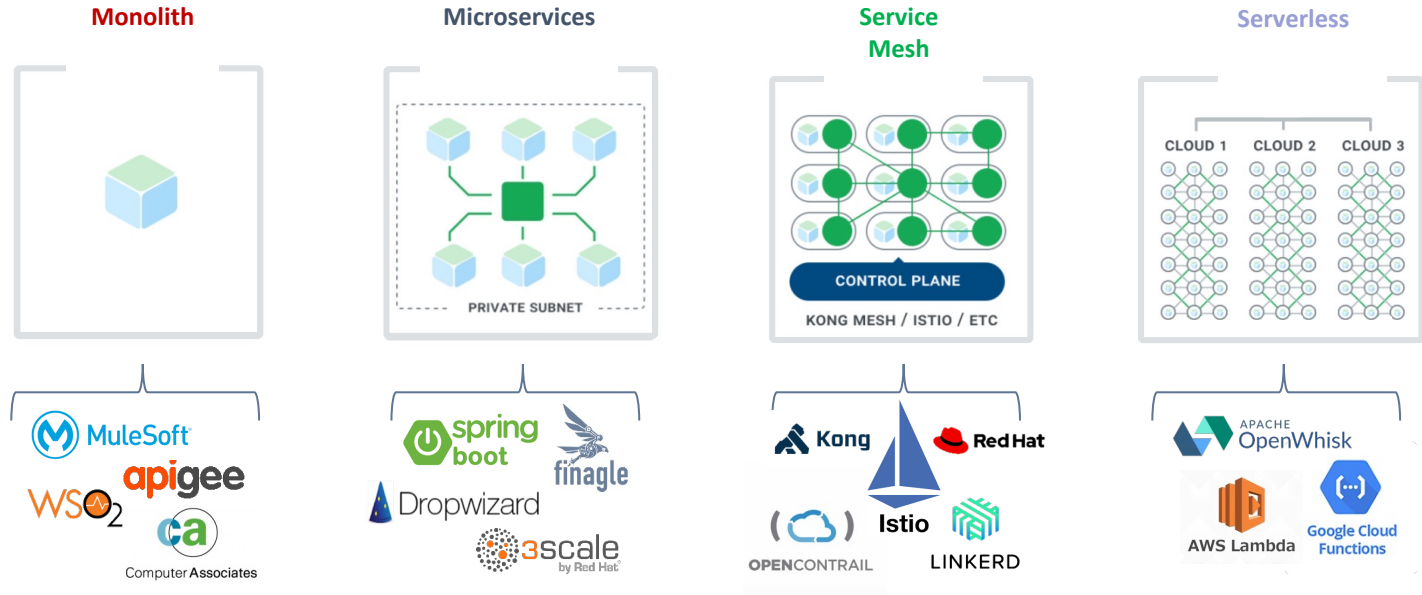

APIs make integration easier, but *only* microservices lead to high-speed

Architecture Roadmap | Enterprise Architecture is evolving very rapidly

Interoperable
APIs

Microservice Architecture Evolution

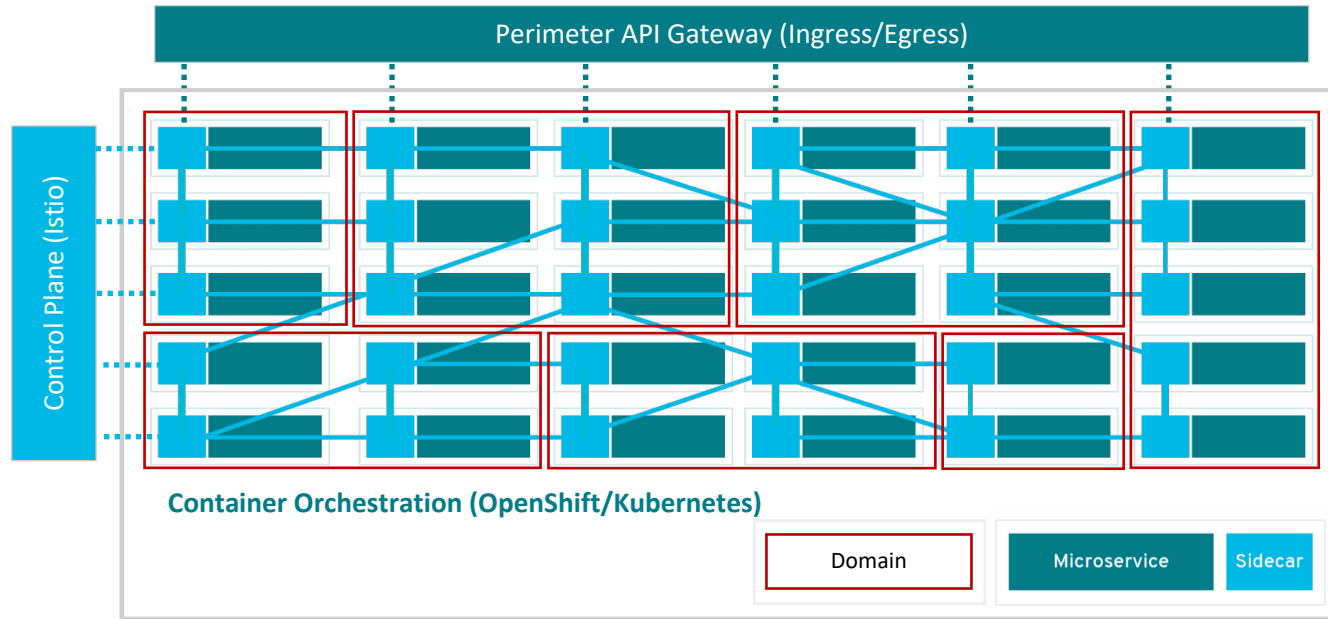

Continuous
Innovation

An accelerating trend towards *batch size reduction* creates more moving

Mr.
Open
Banking

Optimal Architecture | A service mesh architecture is a great fit for open banking

The mesh offers precise control & visibility, while supporting speed & innovation

Is the right architecture enough?

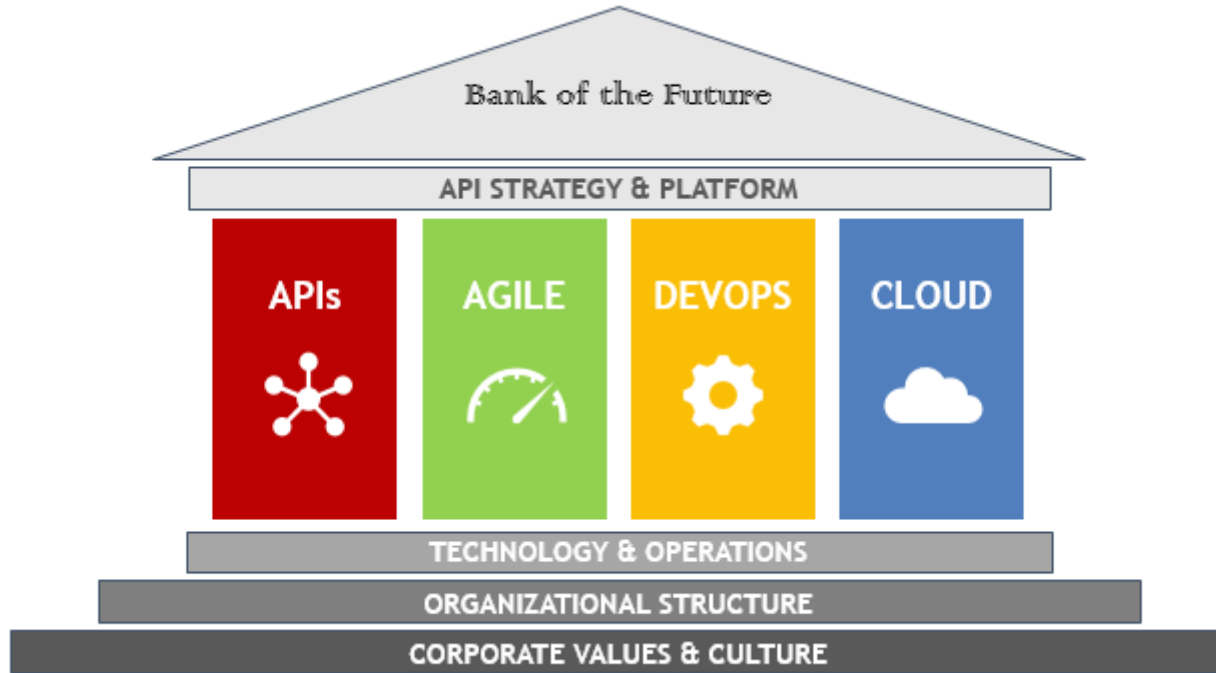

The Wave is Coming | Open banking will likely be difficult and unpredictable

- Developer Demands
- Standards Volatility
- Evolving Security Methods
- Interoperability Issues
- Ongoing Maintenance

**Open banking is not a one-time build.
Expect this to be a journey.**

Although it will be a challenge, open banking prepares you for the digital

Bank of the Future | Success is a technological and cultural balancing act

The pillars give you speed, but only embracing change drives true

innovation

Build for Change | Open banking demands systems that can *evolve*

“There is no design at the beginning. You begin by coding a small amount of functionality, adding more functionality, and letting the design shift & shape.”

Martin Fowler, Software Design Guru, Thoughtworks

Systems that can evolve and adapt are critical to the success of open

**Mr.
Open
Banking**

To be
open,
build for
change.
